

Data Sheet ZJA3216/ZJA3217

Precision 24 MHz CMOS Rail-to-Rail Input/Output Operational Amplifiers

Features

- Continuous Time Amplifier, No Chopper or Auto-zero Glitch
- Low Offset Voltage: 50 µV max
- Low Offset Voltage Drift: 0.2 μV/°C
 - 1 µV/°C max
- Low Input Bias Current: 0.6 pA
 - 3 pA max
- Low Noise: 6 nV/√Hz @1 kHz
 4 nV/√Hz @10 kHz
 - 0.1 Hz to 10 Hz 1.4 μV_{P-P}
- High Unit Gain Bandwidth: 24 MHz
- High Slew Rate: 6.8 V/µs
- Fast Settling Time: 0.5 µs to 0.01%
- Supply Current: 1.8 mA per amplifier
- Wide Supply Voltage: 2.7 V to 5.5 V; ±1.35 V to ±2.75 V
- Rail-to-rail Input and Output
- Drive Large Capacitive Load Up to 10 nF
- Large Output Current: ±150 mA
- Wide Temperature Range: -40 °C to +125 °C

Applications

- Multi-parameter Patient Monitor
- Chemistry and Gas Analyzer
- Multi-pole Filters
- Sensor Analog Front End
- ASIC Input or Output Amplifiers
- ADC Input Driver and DAC Output Buffer
- Photodiode Trans-impedance Amplifier

General Description

The ZJA3216 and ZJA3217 are rail-to-rail input and output, single-supply amplifiers featuring very low offset voltage, wide signal bandwidth, and low input voltage and current noise. The parts use a proprietary trimming technique that achieves superior precision without chopping glitches. The ZJA3216 and ZJA3217 are fully specified to operate from 2.7 V to 5 V single supply.

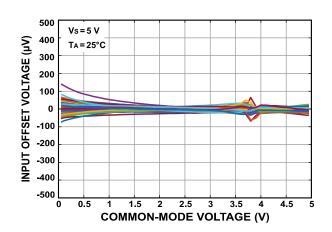

The combination of 24 MHz bandwidth, low offset, low noise, and low input bias current makes these amplifiers useful in a wide variety of applications. Filters, integrators, photodiode amplifiers, and high impedance sensors all benefit from the combination of these features. AC applications benefit from the wide bandwidth and low distortion.

Applications for the parts include portable and low power instrumentation, audio amplification for portable devices and multi-pole filters. The ability to operate rail-to-rail both at the input and at the output enables designers to buffer ADCs, DACs, ASICs, and other wide output swing devices in single-supply systems.

ZJA3216-1 and ZJA3217 are available in 5-lead SOT23 package. ZJA3216-2 is available in 8-lead narrow SOIC and 8-lead MSOP packages. ZJA3216-4 is available in 14-lead SOIC and 14-lead TSSOP packages. All of them are specified over the -40 °C to +125 °C extended industrial temperature range.

General Application Information

Output Phase Reversal

Phase reversal is a change of polarity in the transfer function of the amplifier. This can occur when the voltage applied at the input of an amplifier exceeds the maximum common-mode voltage. Phase reversal can cause permanent damage to the device and may result in system lockups. The ZJA3216-1, ZJA3216-2, ZJA3216-4 and ZJA3217 do not exhibit phase reversal when input voltages are beyond the supplies.

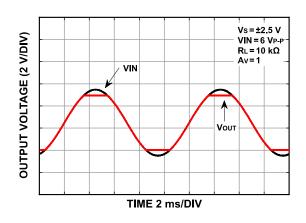

Figure 34. No Phase Reversal

THD+Noise

ZJA3216/7 features low total harmonic distortion (THD) and excellent gain linearity, making these amplifiers a great choice for precision circuits with high closed-loop gain and for audio application circuits. Figure 35 demonstrates that when configured with positive unity gain (the worst case) and driving a 100 k Ω load, the total distortion and noise of ZJA3216/7 is approximately 0.0004%.

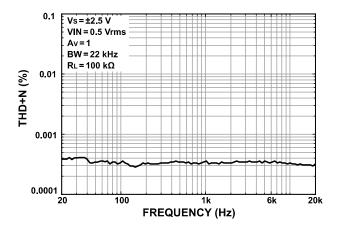

Figure 35. THD+N vs. Frequency

Total Noise Including Source Resistors

The low input current noise and input bias current of the ZJA3216/7 make it the ideal amplifier for circuits with substantial input source resistance. Input offset voltage increases by less than 15 nV per 500 Ω of source resistance at room temperature. The total noise density of the circuit is

$$e_{nTOTAL} = \sqrt{e_n^2 + (i_n R_s)^2 + 4kTR_s}$$

ZJA3216/ZJA3217

Where:

 $e_{\mbox{\scriptsize n}}$ is the input voltage noise density of the parts.

 $i_{n} \, \text{is the input current noise density of the parts.}$

 R_{S} is the source resistance at the noninverting terminal.

K is Boltzman's constant (1.38 × 10⁻²³ J/K).

T is the ambient temperature in Kelvin (T = $273 + ^{\circ}C$).

For R_S < 3.9 k\Omega, e_n dominates and $e_{nTOTAL} \approx e_{n.}$

The current noise of the ZJA3216/7 is so low that its contribution does not become a significant term unless R_s is greater than 165 M Ω , an impractical value for most applications.

The total equivalent rms noise over a specific bandwidth is expressed as:

$$e_{nRMS} = e_{nTOTAL} \sqrt{BW}$$

Where BW is the bandwidth in Hertz.

Note that the above analysis is valid for frequencies larger than 300 Hz and assumes flat noise above 10 kHz. For lower frequencies, flicker noise (1/f) must be considered.

Settling Time

Settling time is the time required for the amplifier output to reach a stable state and remain within a percentage of its step value. The pulse has been applied to the input terminal. Thanks to its high slew rate of 6.8 V/ μ s and 24 MHz bandwidth, ZJA3216/7 settles to within 0.01% in less than 500 ns, for a 2 V step in positive unity gain. This makes it an excellent choice as a buffer at the output of DACs whose settling time is typically less than 1 μ s.

In addition to fast settling time and fast slew rate, the low offset voltage drift and input offset current of ZJA3216/7 allows full accuracy of a 16-bit converter over the entire operating temperature range.

Overload Recovery Time

Overload recovery, also known as overspeed recovery, refers to the time it takes the output of an amplifier to recover from a saturated condition to its linear region. This recovery time is particularly long, which is crucial for the application of amplifiers that must promptly response to small signal in the presence of excessive large transient. Figure 36 shows the positive overload recovery of ZJA3216/7. The output recovers from saturation within approximately 1.2 µs.

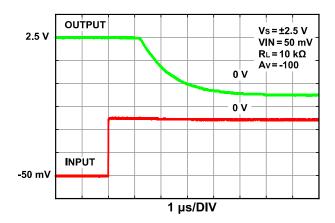

Figure 36. Positive Overload Recovery

The negative overdrive recovery time is also approximately 1.2 µs as shown in Figure 37. In addition to the fast recovery time, ZJA3216/7 show excellent positive and negative recovery time symmetry. This is an important feature of transient signal rectification, as the output signal is kept equally undistorted throughout any given period.

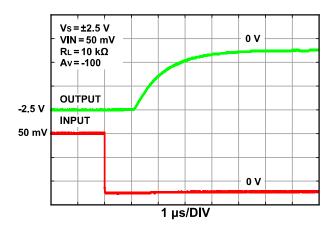

Figure 37. Negative Overload Recovery

Capacitive Load Drive

ZJA3216/7 is unconditionally stable under all gains in both inverted and non-inverting configurations. It is capable of directly driving up to 10 nF capacitive load, without oscillation under positive unity gain configuration (worst case configuration). However, as with most amplifiers, driving larger capacitive loads in a unity gain configuration may cause excessive overshoot and/or ringing, or even oscillation. A simple snubber network reduces the amount of overshoot and ringing significantly. The advantage of this configuration is that the output swing of the amplifier will not decrease, as R_S is located outside the feedback loop.

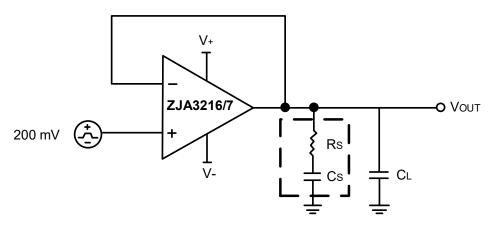

Figure 38. Snubber Network Configuration

Figure 39 shows a scope plot of the output of ZJA3216/7 in response to a 100 mV pulse. The circuit is configured as unity gain (worst case), with a load capacitance of 200 pF, and no ringing is observed at the output.

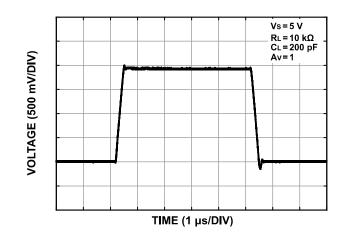

Figure 39. ZJA3216/7 Directly Drive Large Capacitive Load

However, further increase of capacitive load eventually undermines stability and leads to ringing as shown in Figure 40 for Cload of 10 nF. By adding a simple snubber network, it is able to eliminate the ringing as displayed in Figure 41.

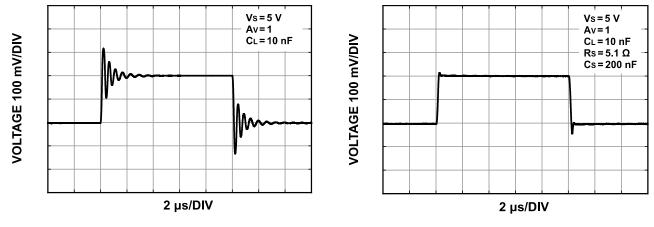

Figure 40. Direct Capacitive Load Drive of 10 nF

Figure 41. Capacitive Load Drive of 10 nF with Snubber

The optimal values of R_S and C_S depend on the load capacitance and input capacitance of ZJA3216/7, which is summarized in Table 1.

CL	Rs (Ω)	Cs
1 nF	100	10 nF
2 nF	50	10 nF
5 nF	20	10 nF

 Table 1.
 Optimum Values for Capacitive Loads

Open-Loop Gain and Phase Response

In addition to impressive low noise, low offset voltage and offset current, ZJA3216/7 has excellent loop gain and phase response even when driving heavy resistive or capacitive load. When the output is loaded with 2.5 k Ω resistor, ZJA3216/7 has unity gain frequency of 24 MHz and a phase margin of 49°. Comparing to amplifiers with similar bandwidth, ZJA3216/7 is much more stable, showing much less peaking in transient response and thus much faster settling time.

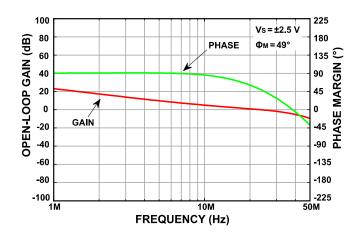

Figure 42. Frequency Response of ZJA3216/7

Photodiode Circuits

Common applications for I-V conversion include photodiode circuits, where the amplifier is used to convert a current, generated by a photo diode placed at the inverting input terminal, into an output voltage.

ZJA3216/7's low input bias current, wide bandwidth, and low noise make it an excellent choice for various photodiode applications, including fiber optic controls, motion sensors, and bar code readers.

The circuit shown in Figure 43 uses a silicon diode with zero bias voltage. This is known as a Photovoltaic Mode; this configuration limits the overall noise and is suitable for instrumentation applications.

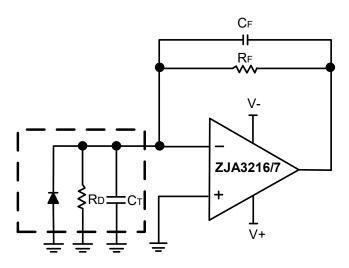

Figure 43. Equivalent Preamplifier Photodiode Circuit

A larger signal bandwidth can be attained at the expense of additional output noise. The total input capacitance (C_T) consists of the sum of the diode capacitance (typically 3 pF to 4 pF) and the amplifier's input capacitance (12 pF), which includes external parasitic capacitance. C_T creates a pole in the frequency response, which may lead to an unstable system. To ensure stability and optimize the bandwidth of the signal, a capacitor is placed in the feedback loop of the circuit shown in Figure 43. It creates a zero and yields a bandwidth whose corner frequency is 1 / (2π (R_FC_F)).

The value of R_F can be determined by the ratio V/I_D, where V is the desired output voltage of the op amp and I_D is the diode current. For example, if I_D is 100 µA and a 10 V output voltage is desired, R_F should be 100 k Ω . R_D is a junction resistance that drops typically by a factor of 2 for every 10 °C increase in temperature. A typical value for R_D is 1000 M Ω . Since R_D >> R_F , the circuit behavior is not impacted by the effect of the junction resistance. The maximum signal bandwidth is

$$f_{MAX} = \sqrt{\frac{f_T}{2\pi R_F C_T}}$$

where f_{T} is the unity gain frequency of the amplifier.

Using the parameters above, $C_F \approx 1$ pF, which yields a signal bandwidth of about 2.6 MHz.

$$C_F = \sqrt{\frac{C_T}{2\pi R_F f_T}}$$

where f_T is the unity gain frequency of the op amp, achieves a phase margin, Φm , of approximately 45°.

A higher phase margin can be obtained by increasing the value of C_F . Setting C_F to twice the previous value yields approximately $\Phi_m = 65^\circ$ and a maximally flat frequency response, but reduces the maximum signal bandwidth by 50%.

ZJC2543-18/16/14	unipolar output	DFN-10 packages			
ZJC2542-18/16/14	18/16/14-bit 1 MSPS single channel DAC with	Power on reset to 0 V (ZJC2542) or V _{REF} /2 (ZJC2544), 1 nV-S glitch, SOIC-14, TSSOP-16,			
ZJC2544-18/16/14	bipolar output	QFN-16 packages			
Amplifier					
ZJA3000-1/2/4	Single/Dual/Quad 36 V low bias current precision	3 MHz, 35 μV max Vos, 0.5 $\mu V/^{\circ}C$ max TCVos, 25 pA max Ibias, 1 mA/ch, input to V-(ZJA3000 only), RRO, 4.5 V to 36 V			
ZJA3001-1/2/4	Op Amps				
ZJA3018-2 ZJA3008-2	OVP ±75 V, 36 V, Low Power, High Precision Op Amp 36 V, Low Power, High Precision Op Amp	1.3 MHz, 10 μ V max Vos, 0.5 μ V/°C max TCVos, 25 pA max Ibias, 0.5 mA/ch, OVP ±75 V (ZJA3018 only), RRO, 4.5 V to 36 V			
ZJA3512-2	Dual 36 V 7 MHz precision JFET Op Amps	7 MHz, 35 V/µS, 50 µV max Vos, 1 µV/°C max TCVos, 2 mA/ch, RRO, 9 V to 36 V			
ZJA3206/06/02-1/2	Precision 24/11.6/5.3 MHz CMOS RRIO Op Amps	24/11.6/5.3 MHz, RRIO, 30 µV max Vos, 1 µV/°C max TCVos, 0.6 pA lb, 2.7 V to 5.5 V			
ZJA3600/1	36 V ultra-high precision in-amp	CMRR 105 dB min (G = 1), 25 pA max lb, 25 μ V max Vosi, ±2.4 V to ±18 V, -40 °C to 125 °C			
ZJA3611, ZJA3609	36 V precision wider bandwidth precision in-amp (G \geq 10)	CMRR 120 dB min (G = 10), 25 pA max lbias, 25 μ V max Vosi, 1.2. 4 V lb 110 V, 40 C lb 125 C			
ZJA3676/7	Low power, G=1 Single/Dual 36 V difference amplifier	Input protection to ± 65 V, CMRR 104 dB min (G = 1), Vos 100 μ V max, gain error 15 ppm			
ZJA3678/9	Low power, G=0.5/2 Single/Dual 36 V difference amplifier	max, 500 kHz BW (G = 1), 330 µA/channel, 2.7 V to 36 V			
ZJA3669	High Common-Mode Voltage Difference Amplifier	±270 V CMV, 2.5 kV ESD, 96 dB min CMRR, 450 kHz BW, 4 V to 36 V, SOIC-8			
ZJA3100	15 V precision fully differential amplifier	145 MHz, 447 V/µS, 50 nS to 16-bit, 50 µV max Vos, 4.6 mA lq, SOIC/MSOP-8, QFN-16			
ZJA3236/26/22-2	Low-cost 22/10/5 MHz CMOS RRIO Op Amps	22/11/5 MHz, RRIO, 2 mV max Vos, 6 $\mu\text{V}/^\circ\text{C}$ max TCVos, 0.6 pA lb, 2.7 V to 5.5 V			
ZJA3622/8	36 V low-cost precision in-amp	0.5 nA max Ibias, 125 μV max Vosi, 625 kHz BW (G = 10), 3.3 mA lq, ±2.4 V to ±18 V			
Voltage Referen	ce				
ZJR1004	40 V supply precision voltage reference	V _{OUT} = 2.048/2.5/3/3.3/4.096/5/10 V, 5 ppm/°C max drift -40 °C to 125 °C			
ZJR1001/2	5.5 V low power voltage reference	V_{OUT} = 2.048/2.5/3/3.3/4.096/5 V, 5 ppm/°C max drift -40 °C to 125 °C, ±0.05% initial error,			
ZJR1003	(ZJR1001 with noise filter option)	130 μA, ZJR1001/2 in SOT23-6, ZJR1003 in SOIC/MSOP-8			
Switches and M	ultiplexers				
ZJG4438/4439	36 V fault protection 8:1/dual 4:1 multiplexer	Protection to ±50 V power on & off, latch-up immune, Ron 270 Ω , 14.8 pC, t _{on} 166 nS			
ZJG4428/4429	36 V 8:1/dual 4:1 multiplexer	Latch-up immune, Ron 270 Ω , 14.8 pC charge injection, ton 166 nS			
Quad Matching	Resistor				
ZJM5400	±75 V precision match resistors	Mismatch < 100 ppm, 10k:10k:10k:10k, 100k:100k:100k:100k, 100k:10k:10k:10k:10k, 1k:1k:1k:1k 1M:1M:1M:1M, 5k:1k:1k:5k, 5k:1.25k:1.25k:5k, 9k:1k:1k:9k, ESD: 3.5 kV
